

WEB AUTOMATION

Autonomous Web Scraping & Browser-Use

Enterprise headless browser automation, anti-detection heuristics, and resilient DOM extraction.

EXECUTIVE SUMMARY

Modern websites employ advanced bot detection including Cloudflare Turnstile, browser fingerprinting, and dynamic JavaScript rendering. This guide provides production strategies for stealth scraping and automated navigation.

1 Stealth Browser Heuristics & CDP Execution

By interacting directly through the Chrome DevTools Protocol (CDP) with modified browser fingerprints, automation scripts execute human-like typing, natural mouse physics, and header consistency without triggering CAPTCHAs.

2 Production Implementation & Schema

```
// Playwright Stealth Automation (Node.js)
const browser = await chromium.launch({ headless: true });
const page = await browser.newPage();
await page.addInitScript(() => {
  Object.defineProperty(navigator, 'webdriver', { get: () => undefined });
});
await page.goto(targetUrl, { waitUntil: 'networkidle' });
```

3 Resilient Semantic DOM Extraction

Rather than relying on fragile CSS class names that change between site updates, extract structured data using semantic tree parsing and fallback regex patterns.

```
scraper-engine • Live Execution CONNECTED

[INIT] Connecting stealth Chromium instance...
✓ [BYPASS] Cloudflare Turnstile handshake: PASSED
[SCRAPE] Extracting directory listings (Page 1 of 5)...
✓ [DATA] 50 verified records extracted • Exported to leads.json & leads.csv
[RATE-LIMIT] Proxy rotation applied • Zero IP blocks detected
```

4 Key Takeaways & Best Practices

✓ Webdriver Masking

Always overwrite navigator.webdriver and Chrome automation flags before navigating to target pages.

✓ Residential Proxies

Rotate IP addresses across distinct subnets when scraping directories to avoid aggressive rate-limiting.

✓ Exponential Backoff

Implement retry queues with jitter delays (1.5s–4s) on HTTP 429 or transient connection timeouts.

✓ Dual Export Formats

Always write extracted datasets simultaneously to JSON (for API use) and CSV (for spreadsheet review).
